GREEN AND DRY WEIGHT YIELDS
FOR
UNTHINNED OLD-FIELD LOBLOLLY PINE PLANTATIONS
IN THE INTERIOR WEST GULF COASTAL PLAIN

J. David Lenhart1

Increasing familiarity with weight-scaling at mills is alerting foresters, wood procurement personnel, and mill management to advantages of timber estimates presented in terms of product weight. This paper presents schedules of merchantable green weight and ovendry weight yields per acre for unthinned old-field loblolly pine (Pinus taeda L.) plantations in the Interior West Gulf Coastal Plain.

MERCHANTABLE GREEN WEIGHT PER ACRE

Recent mensurational work by Hicks, Lenhart and Somberg (1972) has produced equations for predicting green weight of merchantable stems of planted loblolly pine trees. Using these equations in conjunction with schedules of number of trees and total heights by diameter classes developed by Lenhart (1972), tables showing the expected merchantable green weight per acre were calculated. These yields are presented in Tables 1 through 6.

OVENDRY BARK-FREE WEIGHT PER ACRE

Equations for predicting the dry weight of planted loblolly pine trees have been developed by Hyink, Lenhart and Somberg (1972). A procedure similar to that used for green weight yields was followed to calculate the expected ovendry bark-free weight per acre. These yields are presented in Tables 7 through 10.

Assistant Professor of Forest Biometrics, School of Forestry, Stephen F. Austin State University.

Table 1. Estimated merchantable green weight yield per acre, including bark, to a 2.0-inch top d.o.b., of trees 4.6 d.b.h. or larger, for old-field loblolly pine plantations.
