Abstract:

The performance of a rural wastewater treatment facility, Nacogdoches Wastewater Treatment Plant (NWWTP), in East Texas, USA, was assessed from January 2013 through June 2014. The elemental concentrations (Na, Mg, Ca, Ni, Pb, Mn, Cr, Mo, and Cu, Al, As, B, Ba, Ag, Cd, Fe, Hg, K, Se, Zn, Co, P, and S) were measured using inductively coupled plasma optical emission spectrometry. The anion concentrations (Br\(^-\), NO\(_3\)-, NO\(_2\)-, PO\(_3\)\(_4\)-, F\(^-\), Cl\(^-\), and SO\(_2\)\(_4\)-) were measured by ion chromatography. In general, the NWWTP was found efficient in removal to ≥ 96% for metals. The removal efficiency for anions was in the range 33–100% (33% for Cl\(^-\), 39% for F\(^-\), 84% for PO\(_3\)\(_4\)-, and >96% for NO\(_3\)- and NO\(_2\)-). The mean concentrations for Cl\(^-\), NO\(_2\)-, NO\(_3\)-, PO\(_3\)\(_4\)-, F\(^-\), and SO\(_2\)\(_4\)- were in the range 0–172.5, 0.0–0.4, 0.0–18.6, 0.0–98.0, 0.0–0.9, and 4.0–89.4 mg/L, respectively. The concentrations for most metals and anion concentrations, with the exception of phosphates, were found below USEPA maximum contaminant limits.
