Ethical Development and Diversity Training for Educational Leaders

Ilene L. Ingram, Oakland University
Shannon Flumerfelt, Oakland University

In the 21st century schools must meet the challenges of current and anticipated increases in racial and ethnic student populations. In turn, school principals must be prepared to lead diverse student populations to high levels of achievement. To facilitate adequate leadership preparation, therefore, the diversity training of educational leaders in given settings must be reworked so that the achievement gap between non-white and white students can be closed. Furthermore, restructuring of principal training is best accomplished through consensus within the profession, based on the tenets of the democratic values of respect, acceptance, and appreciation of diversity.

The purpose of this paper is to add to the body of knowledge in educational leadership degree and certification programs in regard to diversity standards and social justice relevance. This paper provides an overview of a social justice agenda that includes five key elements. The first is a discussion of the term diversity and American demography. The second element is a summary of the sociopolitical context of social justice. The third element is an examination of multicultural education. The fourth element is an overview of educational administration programs. The last element is a review of the moral and ethical leadership standards for educational administrators.

Diversity and American Demography

An analysis of American demography is useful in understanding the diversity picture in the country. Such an analysis provides for the variety and specificity of indigenous, migrant, and imported populations; the particular scale and regional uniqueness of demographic configurations and patterns of settlement; and the historically embedded
characteristics of dominant cultures and the history of their interaction with minority 
groups. The current state of diversity and American demography in the Consensus 2000 
report outlines unprecedented diversity (Prewitt, 2003-2004). Hence, the data indicate a 
variation towards more diversity and demographic shifts. This degree of transformation 
greatly impacts the practice of school leaders as facilitators of social justice and diversity 
issues.

_Sociopolitical Context of Social Justice_

Current educational reform proposals are deeply rooted in attitudes, values, and 
beliefs about diversity. There are a variety of interpretations of what diversity and social 
justice mean. Moreover, there are political implications embedded in the term diversity, 
when linked to social justice. Those interpretations represent a wide polarization of 
political agendas, including what the national agenda for education should be. When one 
attempts to understand what it means to implement effective politically-motivated school 
policies, the complexity of the sociopolitical context of social justice is confounding. 
Hence, to understand the term diversity, the sociopolitical inflection of social justice must 
be considered next.

Social justice has a particular interpretation in the U.S. when conservative groups 
describe it. The conservative view tends to emphasize rights, laws and the legal system 
based on the belief that the taxonomy of social justice begins with a shared view of 
diversity. In turn, this foundation is essential in establishing a commonly held goal of 
unity of thought. A detractor to this ideology is the belief in diversity of thought. 
Diversity of thought is viewed as contrary to the establishment of one society, the 
“melting pot” concept. Hence, diversity is held in opposition to the implications for
assimilation in the “melting pot” and threatens the conservative view of the essential notion of unity of thought for a successful society (Schlesinger, 1991; Wills, 1994). This view is justified by the experiences of earlier immigrants who readily embraced one American society and developed unity by participating in the “melting pot” dynamics (Gibson & Follo, 1998). This formula for assimilation is one that is readily applied to the role of education whereby conservatives argue that one important role of education is to accomplish the same results for diverse groups. One shortcoming of this view is the difficulty in determining which one ideology to rally society around. Thus, when schools contribute to the making of one American society via this way of thinking, this approach privileges the Western ideologies of the prevailing White, Christian Eurocentric view, as it has historically. In addition, English is the preferred language to this pedagogy. Furthermore, since this ideology is not claimed as representative of various constituents in American society, it is easy for non-white groups to become disenfranchised with this perspective.

While conservatives focus on the word “justice,” conversely, liberals consider more broadly the word “social” in the term social justice. Liberals and growing numbers of educators are concerned about the historical record of underachievement of non-white students. In this view, there is criticism of the analytical, rational “justice” paradigm advocated by conservatives. Since this conservative paradigm reinforces the favoritism inherit in a system that allows a dominant group to both make and benefit from the laws of the land, the need to mend the “torn social fabric,” a term Darling-Hammond (2005) coined to describe the racial and ethnic divide in the U.S., emerges as a call to action from the liberal camp. Hence, an examination of cultural issues of “social” justice
emerges from this platform of unequal institutional norms and social structures in schools. Typically, such an examination results in dissonance. This dissonance reverberates as dissatisfaction with the notion of schools serving society as meritocracies whereby the inequitable practices of society are embedded in education systems that lead to inequitable outcomes. Kozol’s work (2005) brings forth the “in use” shortcomings of the educational system to serve all children. He vehemently describes the shortcomings of the 50 year-old moral victory of Brown v. Board of Education when the evidence of social justice is sorely lacking in educational systems and the schools continue to fail the most vulnerable groups of children in our society who are poor and largely African American.

Multicultural and Multicultural Education

In order to understand diversity, the terms multicultural and multicultural education must be defined. Nieto (2004) does this well, providing the explanation that the term multicultural means inclusive because it includes all people. Multicultural education is in reference to studying the histories, cultures, and stories of all people who populate the world. Following the civil rights movement in the 1950s and 1960s, the case to reframe the racially and culturally biased school curriculum was made by Banks (1994) and other multicultural scholars. These multiculturalists and education scholars provided an historical analysis of how those who have political and economic power have held preeminence regarding how knowledge is constructed (Gay, 2004; Gollnick & Chinn, 2001; Ladson-Billings, 1995; Nieto, 1997; Sleeter, 1996). They argued that a curriculum constructed from the White supremacy paradigm was not relevant to
garnering a better understanding of multiculturalism and appreciation of diversity in a pluralistic society like the U.S.

Interpretations of conservative and liberal views of multiculturalism and multicultural education produce different results in schools (Nieto, 1997). Gibson and Follo (1998) stated the proponents of one American culture, conservatives, believe that multicultural education should not receive merited consideration in the curriculum or, if at all, only “...where there is ethnic diversity or a predominant non-white population” (p. 17). On the other hand, multicultural advocates, liberals, argue that the study of multicultural and multiethnic groups has a legitimate place in the curriculum. According to Gay (2004):

As a concept, idea, or philosophy, multicultural education is a set of beliefs and explanations that recognize and value the importance of ethnic and cultural diversity in shaping lifestyles; social experiences; personal identities; and educational opportunities of individuals, groups, and nations. Consequently, it has both descriptive and prescriptive dimensions. (p. 33)

Gay furthers this thinking as an advocate for multicultural education. As multicultural education grows and more explicitly defines its domains and goals to include descriptive, prescriptive and critical types of theorizing, such as delineating the differences in views of social justice, these dimensions will be more evident and overtly presented in curriculum content.
Educational Administration Programs

In terms of school leadership development, Gay (2004) describes the importance of including multicultural education theory and its meaning for school administration. Levine (2005) has been critical of university leadership programs in this regard because they generally lack content needed for educating a population undergoing dramatic demographic and diversity change. Levine points out the increasing racial, ethnic, cultural, and socioeconomic diversity in the student body as negatively correlated to the recent rise in segregated schooling by race and income. Training educational leaders for multiculturism and multicultural education is one way to influence educational policy and change the educational landscape to create positive school outcomes. He laments that leadership preparation programs appear to be unaware of this phenomenon and the potential for school improvement and better education outcomes in addressing it.

Nieto (2004) made a strong argument in her book, Affirming Diversity: The Sociopolitical Context of Multicultural Education, and stated that educational systems that prepare school leaders do have a history of racism, exclusion, and debilitating ideology. Furthermore, she contested that school leaders in general do not understand how to make equity and social justice actionable. Understanding concepts of cultural, ethnic, and racial diversity and their implications is difficult and such complexity lends to pedagogy for minority student populations bound in low expectations, under achievement, and marginalization. Subsequently, the dynamics for all students to learn are missing when diversity and multiculturism is not embraced. This condition is in great contrast to the desired outcome of administrators actively engaging the tenets of social justice in schools.
In an important paper entitled, *Reculturing the Profession of Educational Leadership: New Blueprints*, Murphy (2002) argued that a new construct for educational leadership must have a social justice focus. Unfortunately, the current educational administration knowledge base does not do this well. It compromises efforts to prepare principals to value diversity and social justice since the existing body of knowledge in the field is predominantly positivist or functionalist (Scheurich, 1995). According to Murphy (2002), “The default to positivism and our fascination with building the academic infrastructure of school administration has produced some serious distortions in what is primarily an applied field” (p. 69). Furthermore, theories of knowledge in the field privilege a White male perspective. Feminist theory and critique, and the voices of “critical” others, are conspicuously absent in the knowledge discourse. Expressing concerns about the knowledge base, Brown and Irby (2006) concluded, “. . . such a knowledge base is inadequate as a conceptual foundation for understanding and informing practice in organizations, as well as for advancing diversity and social justice” (p. 7).

Beyond educational leadership programming, criticism of university programs in a broader sense has been put forth by the late Ernest Boyer (1996). He was highly critical of a lack of focus by schools and universities to contribute to solutions embedded in social justice. He felt that the higher education community should readily provide multiple venues for community-based dialogue. In essence, Boyer called on schools and higher education to stop abrogating their moral mission. Mallory and Thomas (2003) reinforced this view and posited that a vital mission of “. . . colleges and universities is to serve as sites of open inquiry, leading to a deeper understanding of contemporary social
challenges” (p. 2). They go on to say that while the need for sustained forms of inclusive dialogues related to paramount ethical and social issues facing our broader society is critical, “. . . there seem to be few examples in higher education of such conversations” (p. 2).

If higher education was aligned with the mission of social justice, it is possible that leadership programs would also be more closely aligned with it. Certainly, because our democratic way of life requires a concern for equity, the moral and ethical dimensions of school agency are vitally important. Furman and Starratt (2002) describe this well,

Since democratic leadership is moral, leadership practices proceed from this moral sense. It is intentional leadership aimed at enacting the values of democratic community; sociality for its own sake, open inquiry in pursuit of the common good; a deep respect for individuals; celebrating differences; and a sense of interdependence with all life. (p. 124)

Moral and Ethical Leadership Standards for Educational Leaders

Ciulla (2004) describes ethics as being the heart of leadership. Changing historical and incomplete understandings of what it means to lead diverse schools, along with the need for principals to be presently concerned about all children, compels school leaders to be aware of their own moral and ethical platforms and praxis. Leadership programs do have a moral responsibility to train principals to apply moral reasoning and ethical principles to all kinds of situations, problems, and ethical dilemmas encountered on the job (Brown, 2006; Fullan, 2003; Johnson, 2005; Kallio, 1999; Rebore, 2001; Starratt, 2004). Hence, for leadership development programs, the moral and ethical development
of leaders depends on providing learning opportunities to do so. In turn, the standards for practicing and aspiring leaders must adequately address their development needs for diversity, social justice, and multiculturism.

Educational leadership programs may rely on the work of John Dewey (1916), who first taught that a key element to making democracy work is the moral and ethical agency of educators. In this sense, his appeal to democratic education suggested that the educational system and democracy are co-dependent for sustainability. Beckner (1994) and Shapiro and Stefkovice (2001) develop this concept further and indicate that ethical training of leaders must be deliberate. They challenge institutions to make ethical education a necessary inclusion in the training of educational leaders by including ethical training as a program standard and by providing the processes, protocols and structures to accommodate the development of knowledge, values and applications of social justice.

In spite of the complexities of today’s era, it is possible, and is, in fact, necessary to develop a shared vision of leadership in regard to diversity and social justice. The No Child Left Behind (NCLB) legislation and call for accountability, although challenging forces for change, do create positive conditions for school improvement and the alignment of standards for leadership preparation. Brown (2006) states, “Making it possible for all students, regardless of their social, cultural, and economic backgrounds, to achieve high academic standards requires greater leadership skills on the part of the principal than ever before” (p. 525). The Interstate School Leaders Licensure Consortium (ISLLC) standards honor that reality through the comprehensive Standards for School Leaders. Many leadership programs across the country have adopted the ISLLC standards. The ISLLC standards’ taxonomy for leadership development includes the
learning behaviors of knowledge, performance, and dispositions indicators. The series of
standards each begins with a lead phrase regarding the work of a school administrator as
one promoting student success through the behavior descriptions in the standards. When
taken as a whole, the ISLLC standards support the belief that leadership programs must
more broadly focus on the dynamic, complex and diverse schools that await program
graduates. Furthermore, ISLLC Standard 5 addresses the issue of ethical and diversity
development.

These standards are contrasted with Murphy’s (2006) analysis of leadership
programs, encumbered with traditional content, largely irrelevant to the issues of social
justice and diversity. As society’s attention is increasingly focused on schools and the
expectation is for all students to achieve at high levels, despite socioeconomic status,
cultural and language diversity, educational leadership training programs must increase
the pace of diversity training of principals. So, it is timely to examine programming
outcomes for content, program design and other pedagogical improvements that will
render school administrators equipped and capable of leading with the acumen of social
relevance.

The Study

The Aim

The issues of diversity training for educational leaders for this paper draw upon a
study conducted at a Midwestern university’s graduate educational leadership program.
The purpose of the study was to determine if ethical development based on knowledge,
dispositions and performance occurred for educational leadership students, either
practicing or aspiring school administrators. The study examined significant differences
between practicing and aspiring administrators, graduate students completing an 
Educational Specialist degree, in terms of the program’s standards for ethical 
development of school leaders. The study reported on here was theoretically framed by 
Ingram and Flumerfelt (2007) as a discourse on educating multicultural America.

Methodology

The program’s standards, the Interstate School Leaders’ Consortium Standards 
(ISLLC), were self-reported in students’ individual professional growth plan statements. 
Specifically, the study used mixed methods analysis of student professional growth plans 
against ISLLC Standard 5, which states school administrators promote student success 
through integrity, fairness and ethics. This examination was done to identify significant 
differences between practicing and aspiring administrator-students in order to better 
understand student achievement and program effectiveness. ISSLC Standard 5 is further 
delineated by behavior descriptors in three categories of Knowledge, with five 
explications, Dispositions, with eight explications, and Performances, with 16 
explications. In total, 29 descriptions of ethical school leadership behavior were 
examined against students’ professional growth plans.

The data were categorized by two samples, practicing administrators (n=8, 
23.5%) and aspiring administrators (n=26, 76.5%), using qualitative methods. Upon 
review, written descriptions of behaviors expressed as knowledge, dispositions or 
performance, were categorized as one of 29 descriptions of Standard 5 (Fraenkel & 
Wallen, 2003). Once the professional growth plans were examined by the two authors 
who are also program coordinators, the results were forwarded to two statisticians for 
analysis. There were no missing data in the study.
Two statistical tests were used for the quantitative data analysis, the t-test and the cross-tab analysis with a chi-square test. The t-test analysis was conducted with the Knowledge, Dispositions and Performances by examining significant differences in the means of the two samples at an alpha level of .1 to reject the null hypothesis. The cross-tab analysis compared the observed frequency of these distributions with the frequencies expected by chance alone. An alpha level of .1 rejected the null hypothesis that there was no difference between practicing and aspiring administrator-students.

The t-test results showed that there is a significant difference between the self-reported student achievement in ethics in the professional growth plans of the practicing and aspiring administrator-students. Table 1 below presents the mean scores, standard deviations (SD), the degrees of freedom (df), and the probability that differences are not due to chance.

Table 1

*p<.1

From these results, it can be seen that there were significant differences in the results between aspiring and practicing administrators regarding self-reported ethics development that were not due to chance.

The cross tab analyses also showed differing patterns of evidence for ISLLC Standard 5 by the three areas of growth, Knowledge, Dispositions and Performances. In the Knowledge area, four out of the five behavior descriptors were significantly different. The four behavior descriptors are listed in Table 2 below.

Findings

The results of the study are informative regarding to training school administrators, specifically in understanding the differences in diversity learning results of practicing and pre-service leaders. As indicated in Tables 2, 3 and 4 above, there are significantly different learning outcomes in the area of diversity and social justice between the pre-service and practicing administrators. The findings point to the accumulating effect of such differences in the areas of knowledge, disposition and performances. Upon examining the study results described above individually by behavior descriptors, the reported differences are disturbing, but somewhat predictable, since it is assumed that a practicing administrator might learn more from an educational leadership program than a pre-service administrator would. But, when examining the sum total of differences, the accumulating effect of the results in terms of implementing social justice, the differences become alarming. In other words, an individual and summative evaluation of the results whereby the differences are considered separately is not as informative as a formative evaluation of the results’ differences for diversity
training matters for practicing and aspiring administrators. This is important because developing perspectives of social justice are not solely the responsibility of the building administrator, but should involve collaborative work in the school community in fashioning a shared mission, vision and goals. When those perspectives are not shared among formal degree cohort colleagues in a program based on standards that specifically describe learning outcomes as described in Tables 2, 3 and 4, then the concern surfaces that a more dispersed perspective, and possibly a poorly defined one, clearly exists in the schools served by the study’s participants.

While the results of the study do not justify generalizations beyond the sample, for those two groups in the sample, there is regional representation of schools. For the schools represented in this region, there are concerns regarding the implementation of social justice tenets. For example, Table 1 highlights the overall analysis of learning results for diversity in this regard. That is, it concludes that there are significant differences in those results for the two sample groups, pre-service and current school leaders. Given the advanced level of responsibility and experience assumed by practicing school administrators, this conclusion is somewhat predictable. What is of concern, however, is that these two sample groups participated in learning cohorts in one graduate leadership degree program, and in the end, describe different learning results. From these findings, it is suggested that the degree program under examination must consider differentiating instruction in order to advance the learning outcomes of the aspiring administrators in diversity development. Or, the alternative is to accept the differentiated results knowing that these program graduates will practice leadership in the areas of diversity and social justice with significantly different developmental abilities overall.
Table 2 highlights the differences in the knowledge development of four behavior descriptors between the two groups. These knowledge differences do impact learning cultures in schools and learning experiences in classrooms. They include differences in knowledge regarding the purpose of schools, the ethical frameworks of diversity, the values of the diverse community and the history and philosophy of schools in terms of diversity. These differences mean that aspiring leaders self-report that they do not understand the purpose of schools in terms of providing equal, equitable and adequate educational experiences for all. They do not have the knowledge needed to understand the impact of diverse perspectives on learning itself and the value of education for different ethnic backgrounds. On a most basic level, they do not have adequate knowledge on the frameworks of education as related to diversity.

Table 3 highlights the differences in the values development of three behavior descriptors between the two groups. These values differences include overt behaviors, behaviors that hold promise for modeling for students’ values aligned with the tenets of social justice and diversity, unfortunately. They include behavior differences in demonstrating the value in the common good, upholding one's principles in the face of opposition and using the administrative office appropriately for diversity matters. The absence of these values-based behaviors by aspiring administrators means that school environments are lacking critical advocates for social justice. The absence of learning results in these specific areas means that the formal degree program under study is not providing developmentally appropriate values-development learning experiences for the aspiring administrators. Three of the values that drive effective behavior for social justice and diversity in schools are not developed.
Table 4 highlights the differences in performance development of behavior descriptors between the two groups. This list is extensive, including 11 significantly different areas of performance. These areas of difference relate to actions taken with a degree of effectiveness in terms of demonstrating leadership competence in ways that advance the tenets of social justice in schools. Items such as inspiring others, accepting responsibility, influencing the practice of others reflect proficiency in acting in socially responsible manner are missing for the pre-service administrators. Other critical learning outcomes are lacking in the pre-service group, such as using the principal’s office for educational gain, protecting rights and confidentiality, considering prevailing values of diversity and demonstrating diversity sensitivity. These learning outcomes are indicative of practices based on an understanding of the power of the administrative office in advancing diversity tenets. Additional learning results are deficient as well and are based on facilitating a respect for legitimate authority, opening the school to public scrutiny and applying the law fairly without bias are indicative of leadership practice grounded in a broad and fair perspective of the school's role in society.

Overall, these differences in knowledge, values and performance learning outcomes in the two groups represent a noteworthy set of differences in the area of diversity development. The three areas of learning and the 17 behavior areas of difference when considered as a total picture of learning outcomes is alarming. Even if the differences are due to the combination of formal and on-the-job learning practicing administrators have the benefit of drawing upon, the fact that the final self-reported learning outcomes are so divergent indicates that pre-service administrative graduates differentiated learning experiences. If a standard of diversity training for school leaders
is desired, then a common standard of learning outcomes is sensible. In the program under study, the data demonstrate specifically where this did not occur for diversity in the areas of knowledge, dispositions and performances.

Conclusion

Much can be learned from the findings of this study. In particular, specific change strategies regarding diversity training for aspiring and practicing principals can be made. The program under study provided significantly different learning outcome results for social justice and diversity between practicing and aspiring administrators. Hence, recommendations for program improvement include approaches regarding program design, content design, instructional delivery and assessment methods are put forth.

Strategies such as differentiating instruction to provide more experiential and culturally diverse field-based study and internships are given. Additional suggestions, such as individualizing instruction with more specific and formative assessment of learning against the ISLLC standards throughout the tenure of the program are made as well. Using threaded curriculum approaches, whereby diversity and social justice are repeating themes of study through the variety of courses, is essential. Developing additional authentic assessment measures, beyond the methods used for this study, are recommended in order to better triangulate learning outcome data.

The study’s findings confirm that educational leaders cannot practice what they do not know or value. In examining the professional growth plans of the two groups, narrative descriptions did uncover matters of understanding, values and actions that distinguished the graduates as individuals. (Combs, Blume, Newman & Wass, 1974) In doing so, individual perspectives on learning outcomes were obtained, but also the two
student groups could be compared to identify the critical learning differences that occurred. As the aspiring principals did not develop in several diversity areas, it is concluded that the cultural consciousness of this group lacks the capacity as administrators to implement the mission that all children can learn.

Covey (1992) makes a powerful argument that one’s attitudes, beliefs, and values are the foundations for guiding principals at all time, at all places and in all situations. The ISLLC Standard 5 clearly states that aspiring and practicing principals must articulate and share knowledge, dispositions and performances with members of the school community, education’s stakeholders and broader society. It is expected, therefore, that in matters of diversity, preparation should be of the highest quality. Leadership graduates must understand, value, and be willing to act in ways that weave diversity into the fabric of American society. Aspiring and practicing school administrators must be challenged to value diversity in the district, school and classroom and must be prepared to advocate for social justice. In this sense, school principals have the potential for serving as powerful change agents in promoting participation for all students in all schools in all of society. There is clearly more work to do in this regard.
