Early to Mid-19th Century Occupation at the Dead Cow Site (41SM324), Smith County, Texas

Timothy K. Perttula

INTRODUCTION

The Dead Cow site is an early to mid-19th century archaeological site located within the northern part (Sabine River basin) of the proposed Republic of Texas 1836 Cherokee Indians land grant in East Texas (Figure 1), generally east of the downtown area of the modern city of Tyler. Cherokee Indians had moved into East Texas by the early 1820s, and "most of the Cherokees cleared land and carved out farms in the uninhabited region directly north of Nacogdoches, on the upper branches of the Neches, Angelina, and Sabine rivers. By 1822 their population had grown to nearly three hundred" (Everett 1990:24).

To date, historic archaeological sites identified as being occupied by the Cherokee during their ca. 1820-1839 settlement of East Texas remain illusive, and to my knowledge no such sites have been documented to date in the region. This article considers, from an examination of the historic artifact assemblage found here, the possibility that the Dead Cow site is a Cherokee habitation site.

BACKGROUND AND SITE SETTING

Mark Walters recorded the site in January 2005 as a scatter of both prehistoric (lithic debris and a single ferruginous sandstone pitted stone) and 19th century artifacts covering a 30 x 50 m area. The Dead Cow site was found after the land had been cleared for use as a pasture by the landowner; the area has also been mined for sand.

The site is on a lower ridge slope (390 feet amsl), with Cuthbert fine sandy loam sediments, overlooking the floodplain of Ray Creek at its junction with Five Mile Branch. Ray Creek is in turn a tributary of Harris Creek, one of the principal tributaries of the Sabine River in this part of East Texas.

19TH CENTURY ARTIFACTS

The small collection of 19th century artifacts from the surface of the Dead Cow site includes 29 stoneware and whiteware rim, body, and base sherds (Table 1) and four bottle glass sherds (Table 2). The most common artifacts in the assemblage are plain whiteware sherds, probably from plates, bowls, and cups.

Salt-glazed stoneware was one of the more commonly employed glazes in the manufacture of utilitarian stoneware (Greer 1990:180). The absence of salt-glazed stoneware sherds with a natural clay slipped interior surface from the Dead Cow site (but taking into account the small size of the artifact assemblage) suggests that this particular stoneware sherd came from a vessel that was made between the 1830s and ca. 1870 (Lebo 1987:140).

The other ceramics from the site are whitewares, and this type of ware was the predominant type of refined earthenware made after the 1830s (Majewski and O’Brien 1987). About 60% of the whiteware sherds are from the undecorated portions of plates and cups. The earthy tones of the annular wares and mocha ware from the site—white, black, gray, and blue bands—suggest these sherds are from early (ca. 1840s) annular ware. The hand-painted sherds have fine-line polychrome floral motifs, including red dots and green petals as well as black branches, consistent with 1840-1860 hand-painted whitewares (Majewski and O’Brien 1987:157).

The one transfer-printed sherd from the Dead Cow site has a purple geometric pattern. The date range of production of this color of transfer-printed ceramics is 1814-1867 (Samford 2000:Table 5). However, the fact that this transfer-printed sherd is from a whiteware plate would seem to indicate that the occupation of the site could have ranged from ca. 1830-1867.

Both shell-edged plate rims are blue in color (see Table 1). With respect to the rim form of the Dead Cow site shell-edged ceramics, which is
Figure 1. 1836 Cherokee land grant in East Texas.

chronologically sensitive (cf. Hunter and Miller 1994, 2009), both have unscalloped rims and impressed lines (ca. 1830-1860). Hunter and Miller (2009:13) have more recently suggested that this form of rim on shell-edged plates was being made by the 1840s, while the earlier symmetrical scalloped shell-edged ware continued to be made into the 1830s; this earlier form is absent in this small artifact sample.

The few pieces of bottle glass from the Dead Cow site are from hand-blown bottles of several different colors: aqua, colorless, and olive green (Table 2). These are likely from bottles that contained liquor (beer and wine) or patent medicines. None of the bottle glass sherds have embossed lettering, suggesting they predate 1850, when that technique began to be used (Newman 1970:74).

CONCLUSIONS

A small assortment of 19th century artifacts, stoneware sherds, refined earthenware sherds, and bottle glass have been recovered from the Dead Cow site in northern Smith County, and within the boundaries of the proposed 1836 Cherokee land grant. Could this be an archaeological site occupied by the Cherokee Indians during their short stay (ca. 1820-1839) in East Texas?

On the basis of the kinds of artifacts found at the site, no determination of ethnic affiliation can be made. The same types of goods found at the site would have been available to both Cherokee (or other Native American groups in East Texas, including the Caddo) and Anglo-American settlers living in this same area in the 1830s, and no archaeological or historical information is available that suggests that one group or the other had a particular preference for a specific kind of stoneware or refined earthenware. The site also does not contain any historic Cherokee ceramics (of the late Qualla series, made until at least the late 19th century, see Riggs and Rodning 2002). The best available evidence that speaks to the possible ethnic affiliation of the site is the decorated refined earthenware. The preponderance of the evidence regarding the chronological age of these sherds would be consistent with a ca. 1840-1860 occupation, one that would have postdated the Cherokee occupation of East Texas. If the site postdated the Cherokee occupation, it is almost certainly the product of an Anglo-American settlement in the Sabine River basin.

Further archaeological investigations—including shovel testing and systematic metal detecting—seem warranted to gather a larger assemblage of 19th century artifacts from controlled subsurface contexts. A larger assemblage of artifacts would likely contain more chronologically-specific specimens that could refine or refute the findings suggested here. Particular kinds of artifacts may also be found—such as glass beads, silver artifacts or evidence of its workmanship, metal arrow points or other tools made from barrel or kettle scrap, or perhaps even sherds of Cherokee ceramics—that would lend much-needed support to the notion that the Dead Cow site was occupied by the Cherokee Indian peoples in the early part of the 19th century.
